

CHAPTER04 流入流程控制

► 函数参数关键词调用(关键词实现不确定)

```
def myfunc(title, **name):
    print('Hello, ', title, end=' ')
    firstname = ''
    fullname = ''
    lastname = ''
    for each in name.keys():
        if each == 'fullname':
            print(name[each], '!')
            break
        elif each == 'firstname':
            firstname = name[each]
        elif each == 'lastname':
            lastname = name[each]
    else:
        print(firstname, lastname, '!')
myfunc('Dr', firstname='Lee', lastname='Feifei')
myfunc('Dr', fullname='Lee Feifei')
```

CHAPTER04 流入流程控制

▶ 函数参数关键词调用(解包参数列表)

```
def myfunc(title, firstname, lastname):  
    print('Hello, ', firstname, lastname, '!')
```

```
lee = ['Dr', 'Lee', 'Feifei']  
myfunc(*lee)  
leedict = {  
    'title': 'Dr',  
    'lastname': 'Feifei',  
    'firstname': 'Lee',  
}  
myfunc(**leedict)
```
